To whom it may concern,

Re: Professional Reference for Christopher I. V. Farmer

I am [name withheld], Founder of Keystone Analytics. Keystone Analytics builds data systems, AI pipelines and operational infrastructure, with active work across data engineering, AI/RAG systems, technical advisory and full-stack product development. I am writing to provide a professional reference for Christopher I. V. Farmer and to confirm the value of his work with us on agentic AI systems, compliance architecture, market-intelligence logic and strategic advisory.

Christopher has been exceptionally valuable because he operates at the point where legal risk, commercial judgement, data architecture and AI implementation meet. His assistance has gone well beyond ordinary legal review. He has helped translate regulatory and market-structure questions into engineering constraints, control logic, documentation requirements and human-review points that can be built into compliant AI infrastructure from the start.

A major contribution has been his work on agentic AI governance and workflow design. Christopher advised on how AI systems should ingest, retrieve, rank and act on information where outputs may have commercial or compliance consequences. He helped us frame practical safeguards around data provenance, source legitimacy, scraping boundaries, prompt and tool constraints, audit trails, escalation rules and human-in-the-loop validation. In doing so, he brought the rare ability to discuss AI architecture in operational terms while still understanding the legal and regulatory reason each control exists.

Christopher also provided original intellectual property and systems logic from his proprietary trading and market-analysis work. This included a structured approach to trading algorithms and signal modifiers: how to identify the relationship between price movement, analyst-target deltas, client-contract continuity, staffing or cost signals, macroeconomic events, regulatory developments and technical market patterns. Just as importantly, he explained how those modifiers should be searched, weighted and contextualised so that an agentic system does not merely react to surface-level market noise, but retrieves and reasons over the underlying commercial facts. That logic has been directly useful in developing DipRadar, a market-intelligence tool based on Christopher's original concept and now jointly owned by Christopher and me.

In my view, Christopher's strongest quality is not simply that he understands law, finance or technology individually. It is that he can connect them. He can look at a proposed AI or data workflow and ask the questions that determine whether it will be usable in the real world: What is the source of the data? What is the decision boundary? Which signals are material and which are decorative? What evidence needs to be retained? Where does automation stop and human judgement begin? What would a regulator, lender, board or client need to see to trust the system? Those questions materially improved the clarity and defensibility of our work.

Christopher's contribution was also important in commercial and public-interest contexts. On a USD 2M public-private solar initiative in the Philippines, he helped develop the white paper and investor materials, mapped regulatory and banking constraints, and supported a funding strategy that reduced unnecessary dilution while preserving operational control. The work addressed a region affected by recurring blackouts and weak practical infrastructure, where resilient energy and dispatch systems are not abstract conveniences but operational necessities. That same discipline carried into product discussions around Valkyrie Dispatch, AI workflow operations and market-intelligence tooling: he consistently turned broad ambition into structured, implementable requirements.

I would characterise Christopher as a high-trust adviser for environments where technology, data, regulation and strategy have to be solved together. He is rigorous without being obstructive, commercially minded without ignoring risk, and capable of explaining complex systems to both technical and non-technical stakeholders. For a role involving AI, data management, governance, regulated industries, strategic transformation or business-IT translation, I would regard him as a highly credible and valuable candidate.

I am pleased to recommend Christopher and would be comfortable confirming the substance of this reference directly if required.

Sincerely,

_____
